The problem

SYNAPSIO

- Restricted communication between stakeholders in supply chains – Increased risk of the bullwhip-effect
- Fragmented digitalization and no end-to end-visibility to tackle complex and transparent supply-chains – More work to plan supply-chains
- Inflexible supply-chains – Leading to slow reaction times and unnecessary costs
- Increasing geopolitical and economical tension - Higher volatility, supply disruptions and planning uncertainty

Supply-chain inefficiencies can increase operational costs by up to 20%.
Inefficiences include poor Supply-chain-visibility and holding onto more inventory.

The Economist Intelligence Unit estimates the cost of poor supply-chain management to be $1 Trillion annually in 2021

Sources: UIA (2024,2021), Capgemini Research(2021), Deloitte (2021), Economist Intelligence Unit (2021)

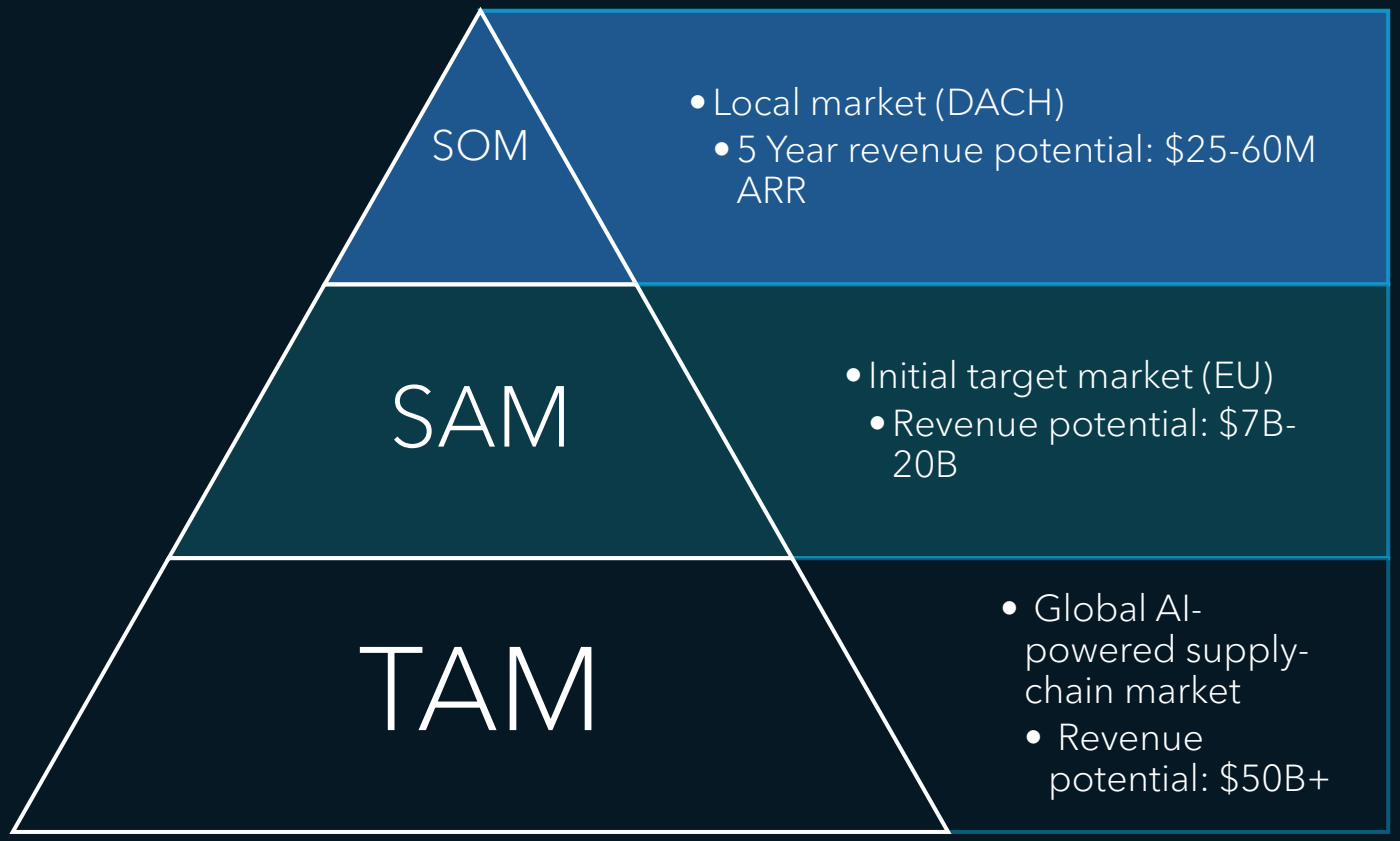
Solution

A fully automated AI-based SCM-solution used for the management and creation of custom supply-chains.

SYNAPSIO

Market opportunity

SYNAPSIO



Opportunity:

AI:

- Supply chain spend on AI is growing with a ~ 35% CAGR increase
- Shifting from pilots to core infrastructure in various industries
- Operational budgets reallocating from legacy tools into AI platforms

Focused entry:

- DACH combines industrial density, logistics leadership, and early AI adoption

Global scalability:

- Asset-light SaaS model enables global expansion without proportional cost growth

SYNAPSIO

One seamless AI-driven ecosystem

Every process, product and partner in one place.

Autonomous supply chain orchestration
End-to-end autonomous planning and execution with minimal human intervention.

Integrated B2B marketplace
Integrated B2B marketplace with AI-driven supplier discovery and pricing

Secure & trusted Network
AI-powered risk detection, supplier validation and fraud prevention across the network

Transaction-Based Business Model
Percentage-based platform fee x network transaction volume = recurring revenue

Key features

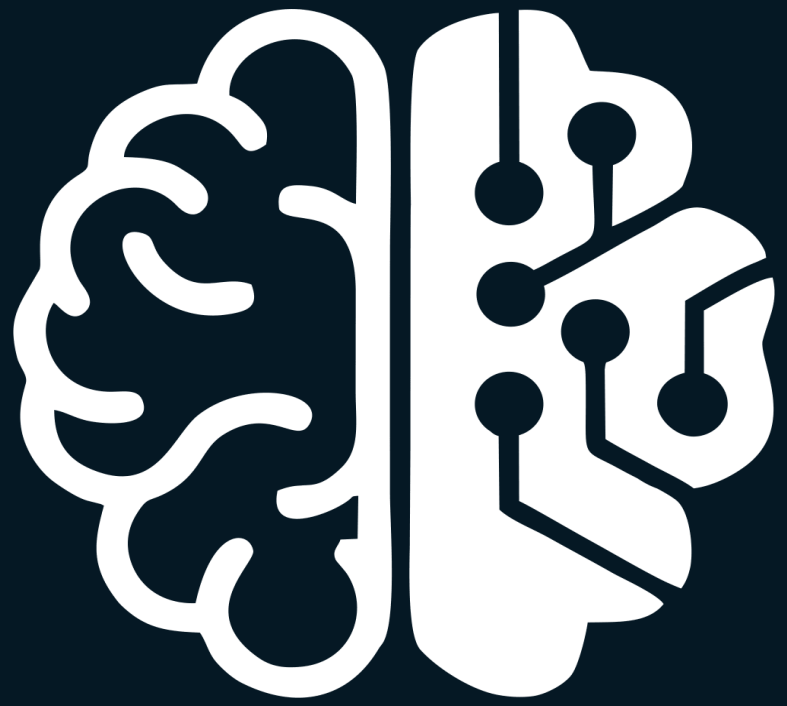
SYNAPSIO

AI-to-AI communication

- Automated supplier communication
- Intelligent P2B & B2B-negotiations
- Cross-company data synchronisation
  - Reduced friction and lower bullwhip effect

Autonomous supply chain operations

- 24/7 AI-driven operational decision-making
- Demand forecasting and auto-replenishment
- Dynamic safety stock optimization



AI marketplace

- Direct producer-to-business trading
- Reduced procurement costs and faster sourcing
- AI-optimized supplier matching and contract negotiation (price, availability, lead time)
- Transaction-based scalability

How it works – workflow of the AI

SYNAPSIO

B2B-marketplace

> Supplier discovery & matching
> Direct producer-to-business connection

AI-to-AI-communication

> Cross-company synergy
> Seamless communication between different synapsio-instances (supplier, buyer)

Sharing

Transactions and data-transfer

Communication

Sourcing

> Inventory management & catalog
> Order history
> Pricing & availability

Planning

> Demand forecasting
> Decision optimization
> Creating supply-chains
> Optimizing existing supply-chains

Executing

> Procurement & auto-replenishment of goods
> Monitoring existing supply-chains
> Contract negotiation & confirmation

Business output

> Higher reliability
> Lower costs
> Less manual work

Competition

Feature	ERP-Systems	SCM-Tools	Synapsio
Automation	Low	Medium	High
AI-native	No	Partially	Yes
Marketplace	No	No	Yes
SME Focus	Medium	Low	High
End-to-End	Partial	Partial	Yes
Autonomous	No	No	Yes

Synapsio combines marketplace liquidity, autonomous execution and AI-native orchestration in one platform

SYNAPSIO

Market landscape:

ERP systems (SAP, Odoo):
- Strong internal planning and accounting
- Limited automation and flexibility
- No cross-company intelligence
- Long implementation cycles

SCM-Software (Coupa, Tacto, Jaggaer):
- Process optimization and analytics
- AI-forward Platforms
- Limited autonomy and closed ecosystems
- Human-driven workflows

Why now – AI as the operating system of supply-chains

Technology:

- SMEs can now access enterprise-grade AI capabilities at low cost
- AI has reached production-level reliability for operational automation
- Significant advances in model stability, infrastructure and tooling – Foundation model performance doubled in the last 3 years (Source: Standford AI Index,2025)

Market Pressure:

- Increasing operational complexity in global supply chains
- Geopolitical disruptions and rising supplier risk lead to fragmented supply chains
- Strong cost pressure and margin compression for SMEs – 63 % of businesses report higher-than-expected losses (Source: WTW, 2025)

Shift/Future:

- SCM-Budgets are shifting toward AI-Based Solutions
- Early Platforms move toward AI-native architectures – Global AI spend in supply chain expected to grow >35% CAGR until 2030 (Source: Gartner, IDC,2025)

AI is becoming the dominating operating system of supply chains by 2030 – Now is the time to act!
